

# Alde Underfloor Heating

Once you have experienced a warm floor,  
you'll never want a cold one again

**Most people never feel comfortable unless their feet are warm and happy, but once they are won't want the heating set so high, saving energy. This is why underfloor heating in caravans and motorhomes is so sought after.**

Hydronic underfloor heating acts as a large, low temperature radiator that spreads and distributes the heat in the vehicle. With the floor about the same temperature as the soles of your feet, you can relax without shoes or socks, and kids and pets can enjoy the floor space. All the while allowing you to lower the thermostat a degree or two.  
Feel comfy bottom to top!

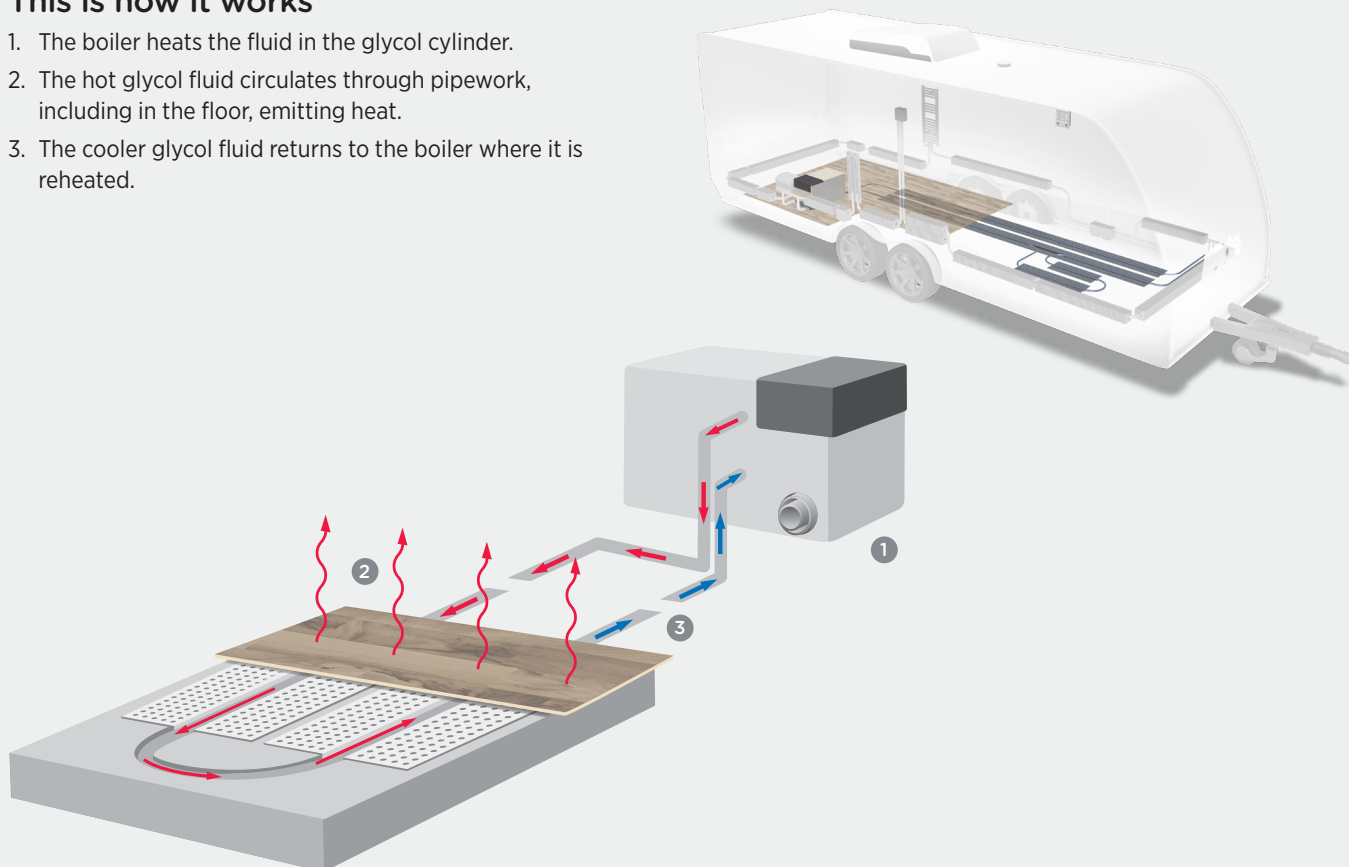

## Alde Underfloor Heating

Alde Underfloor Heating runs in special PE-Xc/Aluminium pipes that are slotted into spreader plates and sandwiched into the floor. These distributed the heat across the floor surface without hot spots. Alde Underfloor Heating is teed into the main circuit of the Alde heating system, using the same glycol fluid.

### This is how it works

1. The boiler heats the fluid in the glycol cylinder.
2. The hot glycol fluid circulates through pipework, including in the floor, emitting heat.
3. The cooler glycol fluid returns to the boiler where it is reheated.

### Advantages with Alde Underfloor Heating

- Comfortable, warm floors that enhance comfort.
- Hydronic efficiency.
- Same comfort at lower room temperatures saves energy.
- Concealed installation, no appreciable loss of space.
- Connected to Alde Heating System.

**Treat yourself and the environment by choosing Alde Underfloor Heating next time you order a new Caravan or Motorhome.**
